

Why choose the LTE router over the modem:

Besides the fast LTE modem, the router is equipped with WIFI and a switch with 3 (4) ports. With this unit, for example a T640 with its LAN connection, is easy to integrate to the airpointer. With its WIFI connection, you can connect easier with your laptop or your tablet computer. We choose a unit with 2 SIM card slots that supports switch over from one to the other on fail or parameters you choose. Another big plus is that it is completely configurable over an internal webpage with very nice wizards. For example, you choose country and provider, that's all with this setup, the unit is in internet.

That's another point, you can keep the setup simple with a short description from us, or experts can do all crazy setups only networking experts understand.

There are different versions for different location, please checkout them here:
